Ticket Summary: Printer Displaying "Offline" Status

The Issue

A user reported that they could not print. Even though the printer was powered on and physically connected, the Windows device status displayed it as "Offline."

The Troubleshooting Steps Performed

1. **Physical Check:** Restarted the printer and verified the USB or network cables were securely connected.
2. **Status Check:** Navigated to *Settings* > *Devices* > *Printers & scanners*, selected the affected printer, and clicked "Open queue."
3. **Settings Verification:** Clicked the "Printer" menu tab at the top left of the queue window.
4. **Offline Toggle:** Found that the "Use Printer Offline" setting was accidentally checked. Uncheck this option to force Windows to look for the active printer.

The Resolution

Unchecking the setting immediately changed the printer's status from "Offline" to "Ready." A Windows test page was sent to the printer and printed successfully, confirming normal operations were restored.
