Report Week 4:

So far, I have verified that the WinServer2025-Lab virtual machine is operational and documented its core virtual hardware specifications, including 4096 MB of RAM, 10 virtual processors, an 80 GB virtual hard disk, a SCSI storage controller (hosting the primary VHDX and installation DVD drive), and a network adapter bound to an External-Switch. Rather than using a complex diagram, I formatted a clean Virtual Hardware Configuration specification summary and embedded validation screenshots of the Hyper-V settings and active VM to serve as visual proof of my findings. For OS-specific details, I verified and recorded the Windows Server 2025 guest environment, noting the active UEFI firmware with Secure Boot enabled and the mounted OS build image. Moving forward, the main sections I still need to complete are cleaning up the pending unconfigured secondary hard drive slot on the SCSI controller.
